

## Lab9

Alternate Logging

## JSON

**JavaScript  
Object  
Notation**

## JSON

Douglas Crockford   
(1955-)

## JSON

**Object:** Name-Value pairs, separated by commas (unordered)

```
{"name1":value1, "name2":value2, .... }
```

Can be null, true/false,  
a string, a number, an  
object or an array

**Array:** (ordered)

```
[element1, element2, ... ]
```

Can be null, true/false, a string,  
a number, an object or an array

## JSON

Very popular

JSON functions in every DBMS  
(including SQLite)

Basic storage in MongoDB

PostgreSQL: json datatype (+ jsonb)

<https://www.postgresql.org/docs/9.6/static/functions-json.html>

## TODAY'S ASSIGNMENT

Create an audit trigger on table people that records only one row per update/insert/delete statement with all modified columns in a single JSON string.

You can start with the audit trigger shown during the lecture (full code in Sakai)

```
create table people_audit(auditid      serial,
                        peopleid      int not null,
                        type_of_change char(1),
                        column_name   varchar(30),
                        old_value     varchar(250),
                        new_value     varchar(250),
                        changed_by     varchar(100),
                        time_changed  timestamp);
```

### One row per change

```
create table people_audit(auditid      serial,
                        peopleid      int not null,
                        type_of_change char(1),
                        changes        json,
                        changed_by     varchar(100),
                        time_changed  timestamp);
```

```
{"column name": [old_value, new_value], "column_name": ...}
```

```
{"column name": new_value, "column_name": ...}
```

```
{"column name": old_value, "column_name": ...}
```

**No null for insert/delete**
